Angular and linear measurements performed on lateral cephalometric radiographs (LCR) play a pivotal role in orthodontic routine diagnostics. Introduced in the 1930s [1] and further developed over many decades, lateral cephalometric analysis on LCR has remained the standard method in clinical routine until today.

Cephalometric analysis is the clinical application of cephalometry. It is analysis of the dental and skeletal relationships of a human skull. It is frequently used by dentists, orthodontists, and oral and maxillofacial surgeons as a treatment planning tool. Two of the more popular methods of analysis used in orthodontology are the Steiner analysis (named after Cecil C. Steiner) and the Downs ...

Cephalometrics is the interpretation of lateral skull radiographs taken under standardized conditions. The patient is placed in a Cephalostat. This positions the patient with their head oriented at 90° to the X-Ray beam at a distance of 5ft from the tube. The film is placed 15 inches from the head.

Accordingly, many orthodontists rarely assess a patient with a frontal cephalometric analysis. Since all orthodontic patients are three-dimensional, they should be evaluated
