Bacteria & Viruses | General Science Quiz - Quizizz

Bacteria are living cells that grow and reproduce in the body and produce toxins or damage tissues they grow in. Viruses use host cells to reproduce, and these host cells usually die when newly produced virus particle are released.

Virus/Bacteria Quiz

Viruses can infect all types of life forms, from animals and plants to microorganisms, including bacteria and archaea. Viruses exist in the form of independent particles, or virions, consisting of: (1) the genetic material, (2) a protein coat, (3) an outside envelope.

Bacteria and Viruses Facts, Worksheets & Basic Information ...

Viruses are not living organisms, bacteria are. Viruses only grow and reproduce inside of the host cells they infect. When found outside of these living cells, viruses are dormant. Their "life" therefore requires the hijacking of the biochemical activities of a living cell. Bacteria, on the other hand, are living organisms that consist of single cell that can generate energy, make its own food, move, and reproduce (typically by binary fission). This allows bacteria to live in many places ...

Virus vs. Bacteria: What is the Difference? | Merriam-Webster

Viruses are tinier than bacteria. In fact, the largest virus is smaller than the smallest bacterium. All viruses have is a protein coat and a core of genetic material, either RNA or DNA. Unlike...

How do viruses differ from bacteria? - WebMD

Bacteria are typically much larger than viruses and can be viewed under a light microscope. Viruses are about 1,000 times smaller than bacteria and are visible under an electron microscope. Bacteria are single-celled organisms that reproduce asexually independently of other organisms. Viruses require the aid of a living cell in order to reproduce.
