Librivox.org is a dream come true for audiobook lovers. All the books here are absolutely free, which is good news for those of us who have had to pony up ridiculously high fees for substandard audiobooks. Librivox has many volunteers that work to release quality recordings of classic books, all free for anyone to download. If you've been looking for a great place to find free audio books, Librivox is a good place to start.

Differential Geometry And Mathematical Physics

"Part II of Differential Geometry and Mathematical Physics is a very important pedagogical contribution and a worthy complement to Part I. It presents fine scholarship at a high level, presented clearly and thoroughly, and teaches the reader a great deal of hugely important differential geometry as it informs physics (and that covers a titanic proportion of both fields).

Differential Geometry and Mathematical Physics: Part II ...

"The book is the first of two volumes on differential geometry and mathematical physics. The present volume deals with manifolds, Lie groups, symplectic geometry, Hamiltonian systems and Hamilton-Jacobi theory. ... There are several examples and exercises scattered throughout the book. The presentation of material is well organized and clear.

The book guides the reader from elementary differential geometry to advanced topics in the theory of Hamiltonian systems with the aim of making current research literature accessible. The style is that of a mathematical textbook,with full proofs given in the text or as exercises.

The differential geometry chapters seem to be devoid of the frustrating esoteric mysteries which are found in most DG introductions. The author makes a successful effort to demystify this subject area. These DG chapters lead smoothly into general relativity, the Schwarzschild solution (i.e. "black holes"), and some basic cosmological models. ...

The senior faculty group in mathematical physics consists of Brian Greene (string theory and cosmology), Duong H. Phong (string theory and differential geometry), Igor Krichever (solitons and integrable models), Melissa Liu (symplectic geometry and general relativity), and Mu-Tao Wang (differential geometry and general relativity).

Traditionally mathematical physics has been quite closely associated to ideas in calculus, particularly those of differential equations. In recent years however, in part due to the rise of superstring theory, there has been a great enlargement of branches of mathematics which can now be categorized as part of mathematical physics.

Before discussing abstract notions of differential geometry, geometric intuition is developed through a rather extensive introduction to the study of surfaces in ordinary space. The book is ideal for graduate and advanced undergraduate students of physics, engineering or mathematics as a course text or for self study.
