### Transfer Of Tlc Screening Methods

The direct transfer of a TLC screening method to an HPTLC–densitometry method according to the model process involves the use of the same solvents in sample and standard solution preparation, the application of the same weights in 10.0 µL of 100% standard and sample solutions as in 2.00 µL in the Minilab method, and the use of the same mobile phase and detection mode.

After running a TLC screening, it is necessary to calculate the retention factors (R f) of the various spots. This can be done with a simple equation: This can be done with a simple equation: where  $R f = 1$  means no retention on TLC (moving up with solvent front) and  $R f = 0$  means no affinity for solvent (staying at starting line).

Similar to other chromatographic methods, thin layer chromatography is also based on the principle of separation. The separation depends on the relative affinity of compounds towards stationary and the mobile phase. The compounds under the influence of the mobile phase (driven by capillary action) travel over the surface of the stationary phase.
