Both MySQLi and PDO have their advantages. However, bear in mind that MySQLi is only used for MySQL databases. Therefore, if you want to change to another database, you will have to rewrite the entire code. On the other hand, PDO works with 12 different databases, which makes the migration much easier.

This a small tutorial on how to update rows in a MySQL database using prepared statements. In this example, I will be using PHP's PDO object. For example, let us say that we have a table called cars and that we want to update the row with the ID "90" (it's Primary Key).

It's written primarily for people currently using the mysql or mysqli extension to help them make the jump to the more portable and powerful PDO.

Database Support The extension can support any database that a PDO driver has been written for.

Why You Should Be Using PHP's PDO for Database Access

`PDO::query()` executes

Bookmark File PDF Using Mysql With Pdo Object

an SQL statement in a single function call, returning the result set (if any) returned by the statement as a PDOStatement object. For a query that you need to issue multiple times, you will realize better performance if you prepare a PDOStatement object using PDO::prepare() and issue the statement with multiple calls to PDOStatement::execute().

core advantage of PDO over MySQLi is in its database driver support. At the time of this writing, PDO supports 12 different drivers, opposed to MySQLi, which supports MySQL only. To print a list of all the drivers that PDO currently supports, use the following code:

PDO vs. MySQLi: Which Should You Use?

Bookmark File PDF Using Mysql With Pdo Object

PDO supports 12 different database systems, whereas MySQLi only supports the MySQL databases. If you only work with the MySQL Database, then you can choose whatever you like. And in other cases, you have to use the PDO. Both are object-oriented and both support the Prepared Statements that will protect your code from SQL injection.
